

Final QA Release Summary Report

1. Executive Summary:

This assessment report outlines the quality assurance efforts completed for the **NOVA Platform**. Testing activities covered the full lifecycle including **Functional UI Verification**, **Regression Mapping**, **API Integration Verification**, and **End-to-End System Integration Testing (SIT)**. The primary target was to validate the core user workflows across authentication, workspace/project tracking, and task execution engine modules.

2. Test Metric & Summary Execution Breakdowns:

Testing Phase / Type	Scheduled Tests	Executed Tests	Passed	Failed	Coverage %
Functional / Manual UI	10	10	8	2	100%
API Integration (RestAssured)	5	5	5	0	100%
Automated E2E (Selenium)	4	4	4	0	100%
Total Test Suite Summary	19	19	17	2	100%

3. Defect Overview & Severity Metrics:

A total of 4 **distinct software defects** were identified, logged, and isolated during the manual execution phases.

- **Critical / High Blocker:** 2 Defects *(Includes system crashes, field type handling failures, and session handling drops)*
- **Medium Functional:** 2 Defects *(Includes silent input drops, missing input field validations, and mobile responsiveness layout breaks)*

4. Compatibility Environment Sign-Off:

Cross-browser compatibility testing scripts were evaluated successfully across major engines:

- **Desktop:** Google Chrome (v153.0), Mozilla Firefox (v125.0), and Microsoft Edge (v153.0).
- **Mobile Responsive Viewports:** Redmi Note 13 Pro (Simulated Device Views).
- *Note: A UI layout breaking defect (BUG-007) was isolated specifically under small form-factor portrait dimensions when manipulating columns.*

5. API Testing result:

API Testing Breakdown (Postman Suite)

The API integration layers were verified using a modular Postman collection executing sequenced transactional requests.

- **TC-API-001 [POST] User Authentication:** Sends authorization payloads (abiduddina69@gmail.com) to extract the runtime environment bearer token securely.
- **TC-API-002 [POST] Task Creation:** Dynamically injects the extracted `{{authToken}}` header key context to verify task initialization parameters with assertion validation checks (status: 201).

6. Final Release Recommendation:

- **Current Status: CONDITIONAL RELEASE (HOLD recommended for hotfix)**
- **Justification:** While the automated test collection pipelines (both API and E2E Web UI flows) passed successfully under standard happy paths, the discovery of **two High-Severity defects** (BUG-002, BUG-004) poses stability risks to production environments. .
- **Next Steps:** It is recommended that engineering teams deploy hotfixes targeting the two High-Severity items, followed by a condensed 1-day QA regression loop to grant full, unconditional production sign-off.
